SMART ATTENDANCE SYSTEM USING FACE RECOGNITION ABSTRACT: To maintain a discipline and late students grass atmost knowledge in schools, istitutions the attendance system was introduced.face is the important part of the human body that uniquely identifies a person. Using the face characteristics as biometric, the face recognition system can be implemented. The most demanding task in any organization is attendance marking. In traditional attendance system, the students are called by the teachers and their presenty or absenty is marked accordingly. However, these traditional techniques are time consuming and boring. In this project, the Open CV based face recognition approach has been proposed. This model includes a camera that captures an input image, an algorithm for detecting face from an input image, encoding and identifying the face, marking the attendance in a exelsheet and converting it into PDF file. The training database is created by training the system with the faces of the authorized students. The cropped images are then stored as a database with corresponding labels. The features are extracted using LBPH algorithm.
